1. Why R

1. Why R

Intro to R

What is R?

- R is a FREE *language and environment* for statistical computing and graphics.
- R provides a wide variety of statistical and graphical techniques, and is highly extensible.
- It can be used for simple tasks to highly complex reproducible projects.
- It compiles and runs on a wide variety of UNIX platforms and similar systems Windows and MacOS.

1. Why R

Pros

The system is

- Free
- It's platform independent
- It is constantly improving (2 new versions/year)

It is a statistical tool

- Implements almost every statistical method that exists
- Great graphics
- Simple reporting tools
- Also state-of-the-art in Bioinformatics through the [Bioconductor Project](#).

Programming language

- Easy to automate repetitive tasks Possibility to create user friendly web interfaces with a moderate effort.

1. Why R

Cons

- R is mainly used issuing commands from a console
 - less user friendly than almost any other statistical tool you may know.
- Constantly having new versions may affect our projects
- Not necessarily the best language nor suitable for every existing task

2. First steps in R and RStudio

2. First steps in R and RStudio

Install R and RStudio

Get to know R.

- Visit the R-project page and see what can be found there.
- If you haven't done it before, download and install R and Rstudio in your computer
 - <https://cran.r-project.org/>
 - <https://posit.co/products/open-source/rstudio/>
- Open R studio. Look at the panels and figure out what can we do at each window.

2.First steps in R and RStudio

- Data managed in R ...
is stored as *variables (objects)*
- Variables can be of distinct *types*
 - Numerical
 - numeric (13.7)
 - int (3)
 - Character
 - "R is cute"
 - Factors
 - A,B,C,D
 - WT, Mut
- Variables can be contained in distinct *structures*
 - vectors
 - matrices
 - data.frames
 - lists
 - tibble

2.First steps in R and RStudio

Vectors: a collection of numbers or characters:

```
myvec <- c(10,20,30,40,50)
```

```
myvec
```

```
## [1] 10 20 30 40 50
```

```
myvec + 1
```

```
## [1] 11 21 31 41 51
```

```
myvec + myvec
```

```
## [1] 20 40 60 80 100
```

```
food <- c("eggs", "beans", "bacon", "sausage")
```

2.First steps in R and RStudio

Dataframe: is a table or a two-dimensional array-like structure in which each column contains values of one variable and each row contains one set of values from each column :

iris

Species	Sepal.Length	Sepal.Width	Petal.Length	Petal.Width
setosa	5.1	3.5	1.4	0.2
setosa	4.9	3.0	1.4	0.2
setosa	4.7	3.2	1.3	0.2
versicolor	7.0	3.2	4.7	1.4
versicolor	6.4	3.2	4.5	1.5
versicolor	6.9	3.1	4.9	1.5
versicolor	5.5	2.3	4.0	1.3
virginica	6.3	3.3	6.0	2.5
virginica	5.8	2.7	5.1	1.9
virginica	7.1	3.0	5.9	2.1
virginica	6.3	2.9	5.6	1.8
virginica	6.5	3.0	5.8	2.2

3. Install packages in R

3. Install packages in R

- Packages are extensions of the basic R functions
- It is necessary to install once in each computer when needed
- Call it each time you want to use it
- Two ways to install the packages:

`install.packages("name of the package")`

3. Install packages in R

The screenshot shows the R Studio interface. On the left, the 'Install Packages' dialog box is open, with a red circle highlighting its content. It includes fields for 'Install from:' (Repository (CRAN)), 'Packages (separate multiple with space or comma):', 'Install to Library:' (C:/Users/rgonz/Documents/R/win-library/4.0 [Default]), and a checked 'Install dependencies' checkbox. On the right, the 'Packages' pane is visible, with a red box highlighting the 'Install' button. Below the button is a table of installed and available packages.

Name	Description	Version
User Library		
<input type="checkbox"/> abind	Combine Multidimensional Arrays	1.4-5
<input type="checkbox"/> acepack	ACE and AVAS for Selecting Multiple Regression Transformations	1.4.1
<input type="checkbox"/> ActivePathways	[Failed to read package metadata]	[Unknown]
<input type="checkbox"/> ade4	Analysis of Ecological Data: Exploratory and Euclidean Methods in Environmental Sciences	1.7-15
<input type="checkbox"/> anaStatsUEB	Statistical analysis function, Statistics and Bioinformatics Unit (UEB, VHIR)	0.0.0.9000
<input type="checkbox"/> annotate	Annotation for microarrays	1.66.0
<input type="checkbox"/> AnnotationDbi	Manipulation of SQLite-based annotations in Bioconductor	1.50.3
<input type="checkbox"/> arsenal	An Arsenal of 'R' Functions for Large-Scale Statistical Summaries	3.5.0
<input type="checkbox"/> askpass	Safe Password Entry for R, Git, and SSH	1.1
<input type="checkbox"/> assertthat	Easy Pre and Post Assertions	0.2.1
<input type="checkbox"/> backports	Reimplementations of Functions Introduced Since R-3.0.0	1.1.10
<input type="checkbox"/> base64enc	Tools for base64 encoding	0.1-3

3. Install packages in R

- If package are hosted in Bioconductor repository:

```
if (!requireNamespace("BiocManager", quietly = TRUE))  
  install.packages("BiocManager")
```

```
BiocManager::install("airway")
```

3. Install packages in R

Cran R

magrittr

dplyr

ggplot2

pheatmap

RColorBrewer

ggbeeswarm

4. Data manipulation with R

4. Data manipulation with R

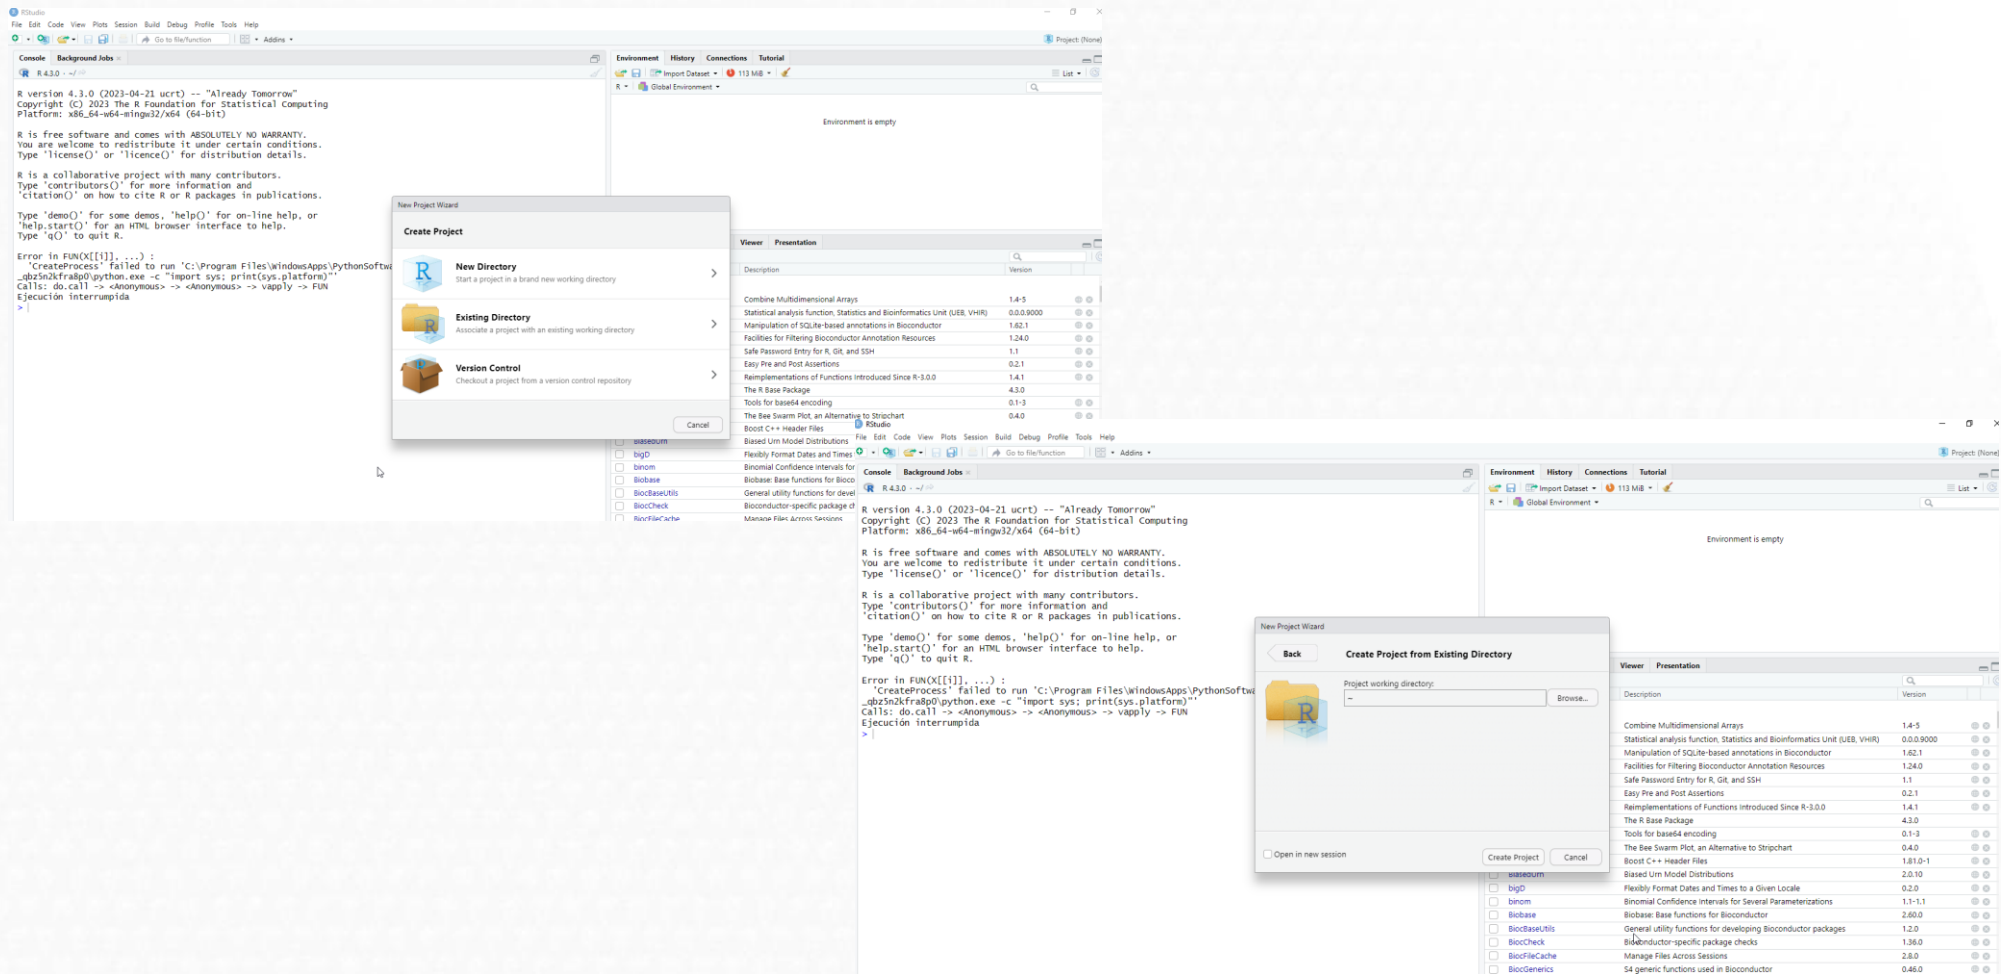

Create a project

- Files can be read from any location, let it be a physical support or a web site.
- The simplest and best way to control file location and modularity of your analyses is to create an Rstudio project for each new analysis.
 - Easy way to keep together your data, code and results.
 - Increases portability (avoids forgetting a file in an external folder).
 - It opens the door to infinite possibilities when you learn to *clone* github projects.

4. Data manipulation with R

Create a project

- Menu File > New Project

2. Data manipulation with R

1. Open a markdown document
 - a. Menu File > R Markdown...

2. Open a csv file or an excel file (2 ways):
 - a. With R command line instructions:

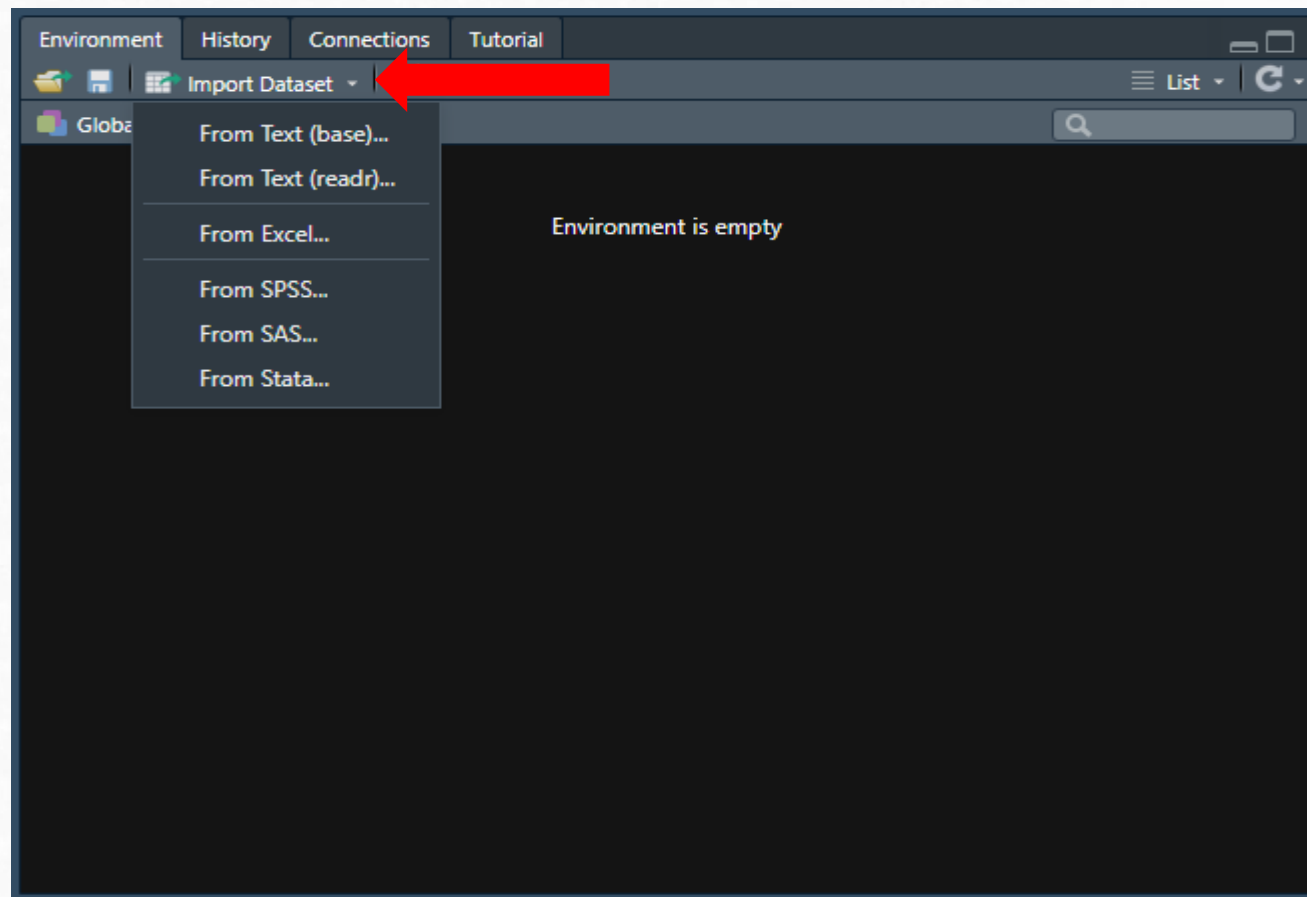

```
osteoporosis2 <- read.csv2("osteoporosis.csv", sep = "\t", dec = ",", header = TRUE)
```

check the folder you are working on!

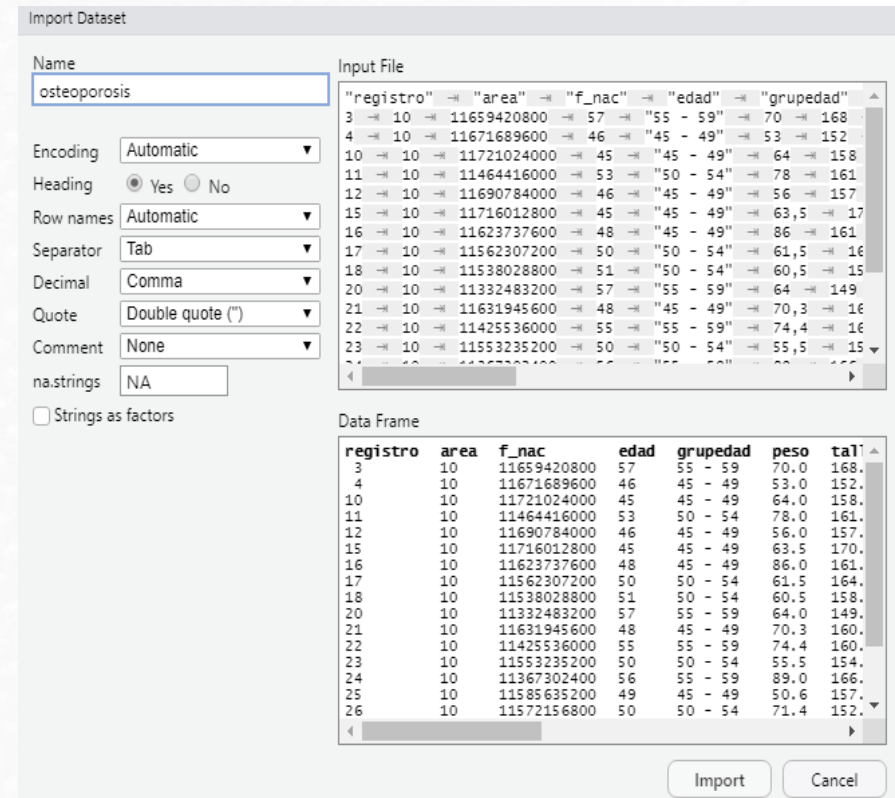

4. Data manipulation with R

b. The easiest way to get data into R is to click on the “Import Datasets” button.

4. Data manipulation with R

- The easiest way to get data into R is to click on the “Import Datasets” button.

4. Data manipulation with R

What type of data is this?

4. Data manipulation with R

- Once you have loaded the data, it is necessary to check it
- Different ways to do it:
 - `head(name of dataframe)`: to see the first rows of a dataframe
 - `tail(name of dataframe)`: to see the last rows of a dataframe
 - `str(name of dataframe)`: to check the structure of the dataframe and their variables
 - `summary(name of dataframe)`: Descriptive summary of the variables of the dataframe

4. Data manipulation with R

```
head(osteoporosis)
```

5.Plots with R

5. Plots with R

- R is a powerful tool to plot your data
- Hadley Wickam (2009) introduced a modern (and perhaps easier) way to plot your data
- Extensions to ggplot2
 - GGally, ggrepel, ...

5. Plots with R

```
bp <- ggplot(osteoporosis, aes(x = grupedad, y = bua)) +  
  geom_boxplot(fill='#A4A4A4', color="darkred")
```

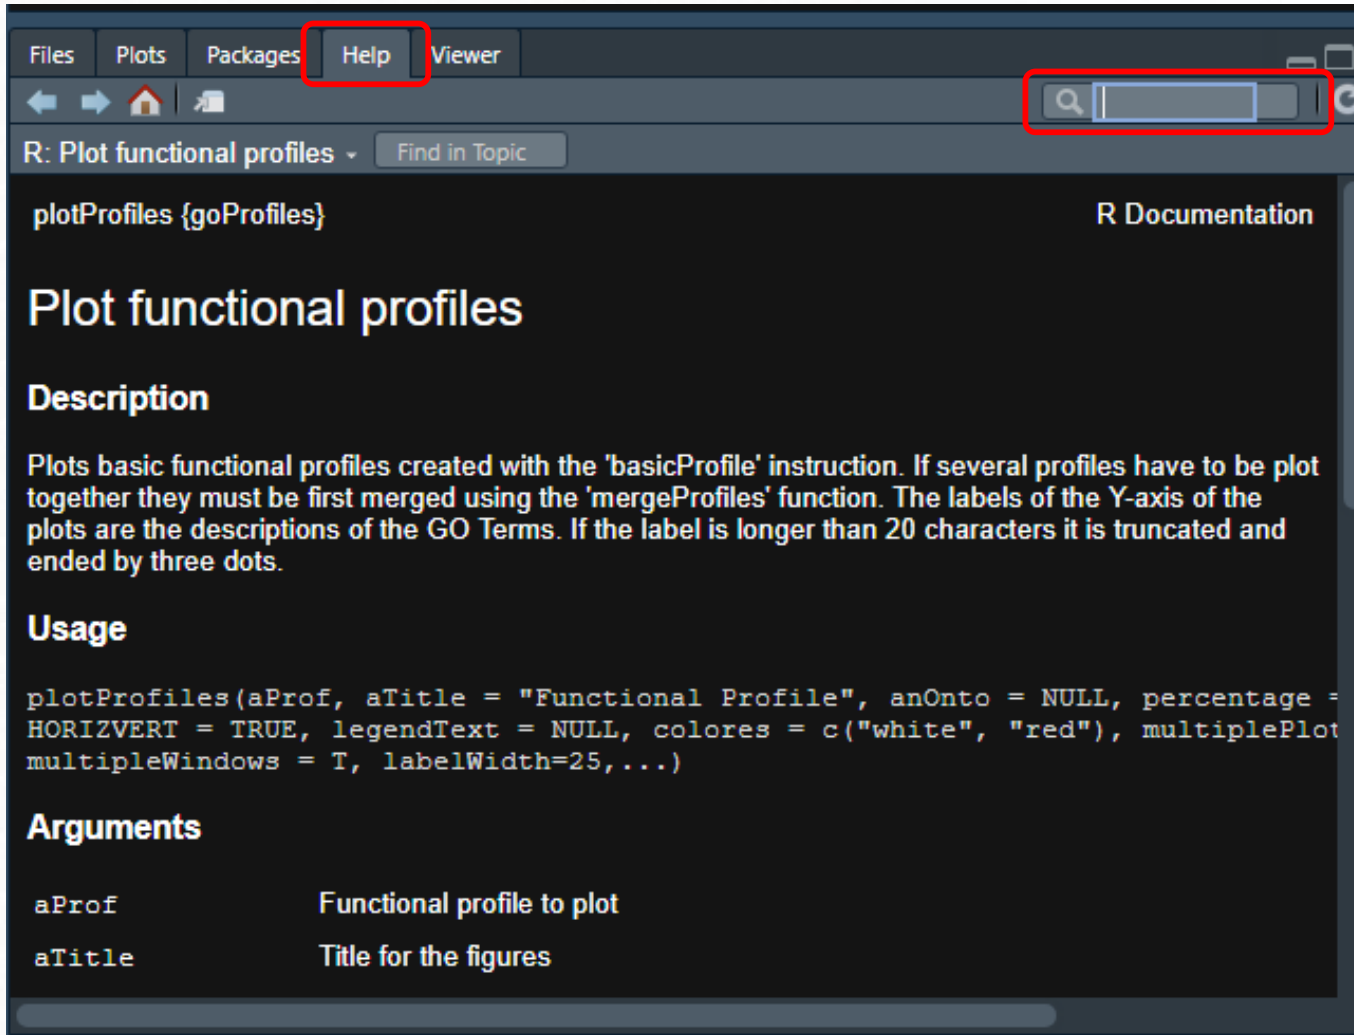

5. Plots with R

```
bp + geom_jitter(shape = 16, position = position_jitter(0.2)) +  
  labs(x = "Age Group", y = "Women", title = "Osteo disease classified by age group")
```

6. Help!!

6. Help!!

The screenshot shows the R Help Viewer interface. The top menu bar includes 'Files', 'Plots', 'Packages', 'Help', and 'Viewer'. The 'Help' menu is highlighted with a red box. Below the menu bar is a search bar, also highlighted with a red box, containing a magnifying glass icon and a text input field. The main content area displays the documentation for 'plotProfiles {goProfiles}'. The title 'Plot functional profiles' is prominently displayed. Below the title, the 'Description' section explains that these are basic functional profiles created with the 'basicProfile' instruction, and that multiple profiles must be merged using 'mergeProfiles' before plotting. The 'Usage' section provides the function signature: `plotProfiles(aProf, aTitle = "Functional Profile", anOnto = NULL, percentage = HORIZVERT = TRUE, legendText = NULL, colores = c("white", "red"), multiplePlot multipleWindows = T, labelWidth=25,...)`. The 'Arguments' section lists the parameters: `aProf` (Functional profile to plot) and `aTitle` (Title for the figures).

plotProfiles {goProfiles} R Documentation

Plot functional profiles

Description

Plots basic functional profiles created with the 'basicProfile' instruction. If several profiles have to be plot together they must be first merged using the 'mergeProfiles' function. The labels of the Y-axis of the plots are the descriptions of the GO Terms. If the label is longer than 20 characters it is truncated and ended by three dots.

Usage

```
plotProfiles(aProf, aTitle = "Functional Profile", anOnto = NULL, percentage = HORIZVERT = TRUE, legendText = NULL, colores = c("white", "red"), multiplePlot multipleWindows = T, labelWidth=25,...)
```

Arguments

<code>aProf</code>	Functional profile to plot
<code>aTitle</code>	Title for the figures
